

Section B19 Boom Vang Lugs

B19.1 Boom Vang Lugs - Alloy

Designed for use with Rodkicks and vang tackles on customised mast-section booms, the alloy Boom Vang Lug is an alternative to a stainless steel lug (see B10.1). The alloy lug spreads the load through the boom by means of a long, broad internal base plate shaped to fit the curvature of the boom section. The base plate is fixed inside the boom, and the body of the lug (which has a hole to accommodate the Rodkick or boom vang pin) protrudes through a slot cut in the bottom of the boom section.
